

Part 1

Create a console based program that will allow a user to find anagrams of a provided word from a dictionary of words.

Two strings are anagrams if they have the same letters and counts of letters (care and race).

The program will be started with a dictionary file specified. The dictionary file is a text file where each line has a single word. Empty lines and lines which start with '#' (comment lines) have to be ignored.

Part 2

If a "-multiple" command line argument is specified, the answers should include multiple word from the dictionary that can form an anagram of the original word.

For example, if the given word is "Incredible" the answers should include "Blinder Ice" and "Rib Decline"
